Brain Networks

- Human brain are at the center of neurobiological systems.
 - The interactions between brain regions are key driving factors for disorder analysis.
- Brain network: composed by nodes representing brain regions and edges representing interactions between them.

Brain Network Analysis

- Input: a brain network dataset of N subjects $D = \{G_n, y_n\}_{n=1}^N$
 - $G_n = \{V_n, E_n\}$: brain network of subject n
 - y_n : prediction label (e.g., neural diseases)
- Properties:
 - In D , $\forall n, V_n = V = \{v_i\}_{i=1}^M$
 - $W_n \in \mathbb{R}^{M \times M}$ describes the connection strengths between ROIs: real-valued and noisy
- Output: a prediction \hat{y}_n for each subject n
 - can be further analyzed for biomarkers

Graph Neural Networks

- Goal: efficient feature learning for machine learning on graphs
- Low-dimensional node embeddings encode both structural and attributive information

The Uniqueness of Brain Networks

- Lack of initial node (ROI) features
- Real-valued connection weights can be both + or –
- The fixed ROI identities and orders across individual graphs

→ The design of GNN models for brain network should be customized to fit its unique nature

Challenges

- Step 1: brain network construction
 - Restricted data accessibility
 - Sophisticated brain imaging preprocessing and network construction processes that differ across modalities
- Step 2: analyze the resulting brain connectivity
 - Establish a standard evaluation pipeline based on fair experimental settings, metrics and modular-designed baselines

Neuroimaging Acquisition

- Various medical imaging techniques: MRI, EEG, PET, etc.
- Magnetic-Resonance Imaging (MRI) are the most widely used for brain analysis research.
 - **Function MRI (fMRI)**
 - functional brain networks
describe correlations between time series signals of brain regions
 - **Diffusion Tensor Imaging (DTI)**
 - structural brain networks
describe the physical connectivity between gray matter regions

Challenges in Dataset Construction

- Raw MRI data is not directly usable for brain network construction and analysis → complicated preprocessing pipeline.
- Preprocessing steps are distinctive across modalities.
- The functionality of existing software tools varies. For dMRI, none existing software contains all the necessary preprocessing capabilities.

Functional Brain Network Construction

Functional MRI Data Preprocessing		SPM 12	AFNI	FSL	Free Surfer	CONN	fMRI Prep	ANTs	Nilearn
Brain Extraction		✓	✓	✓	✓		✓	✓	✓
Remove voxels not necessary for analysis such as bone, dura, air, etc., leaving just the brain									
Slice-Timing Correction		✓	✓	✓	✓	✓	✓		
Adjust for the fact that each slice in the volume is taken at a different time, not all at once									
Motion Correction/Realignment		✓	✓	✓	✓	✓	✓	✓	
Correct movement made during scanning by aligning all the functional images with one reference									
Co-registration		✓	✓	✓	✓	✓	✓	✓	
Align participant's functional images with the anatomical structural images for localization									
Normalization		✓	✓	✓	✓	✓	✓		
Wrap the data across subjects to a template/atlas standardized space									
Smoothing		✓	✓	✓	✓	✓		✓	✓
Perform weighted averages of individual voxels with neighboring voxels									
Functional Brain Network Construction									
Brain Region Parcellation	Construct Network	Recommended Software: CONN, GraphVar, Brain Connectivity Toolbox							
Segment each subject into the ROI defined by the given atlas	Calculate pairwise correlations between ROIs as edges								

Fig. 2: The framework of fMRI data preprocessing and functional brain network construction procedures, with recommended tools for each step shown on the right. The more commonly-used tools for the functional modality are placed at the front.

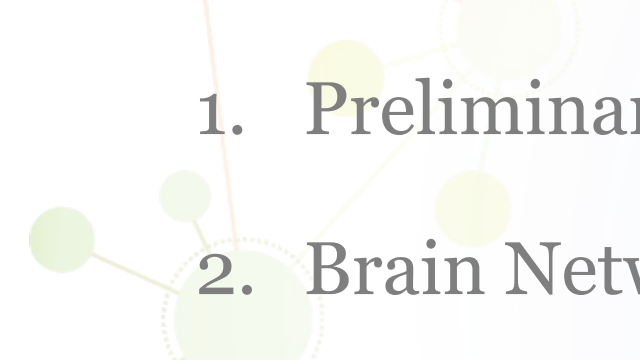

Structural Brain Network Construction

Diffusion MRI Data Preprocessing		FSL	AFNI	Free Surfer	Track Vis	3D Slider	Tortoise	MRtrix3	DSI Studio
Eddy-current and Head Motion Correction		✓	✓	✓		✓	✓	✓	✓
Align all raw images to the b0 image to correct for head motion and eddy current distortions									
EPI Induced Susceptibility Artifacts Correction		✓	✓	✓		✓	✓	✓	
Correct the spatially nonlinear distortions caused by B ₀ inhomogeneities in Echo-planar imaging									
Brain Extraction		✓	✓	✓		✓		✓	✓
Remove voxels not necessary for analysis such as bone, dura, air, etc., leaving just the brain									
Reconstruct Local Diffusion Pattern		✓	✓	✓	✓	✓	✓	✓	✓
Fit a diffusion tensor model at each voxel on preprocessed and eddy current corrected data									
Tractography		✓	✓		✓	✓		✓	✓
Reconstruct brain connectivity graphs using brain tractography algorithms like FACT									
Brain Region Parcellation		✓	✓				✓	✓	✓
Parcellate ROIs from T1-weighted structural MRI									
Structural Brain Network Construction		Recommended Software: FSL, Metric, DSI Studio							
Construct Network									
Compute the network based on the generated label and the reconstructed whole brain tractography									

Fig. 3: The framework of dMRI data preprocessing and structural brain network construction procedures, with recommended tools for each step shown on the right. The more commonly-used tools for the structural modality are placed at the front.

Outline

- 
1. Preliminaries
 2. Brain Network Dataset Construction
 3. GNN Baselines for Brain Network Analysis
 4. Experiments
 5. Discussion and Extensions
- 

M1: Node Feature Construction

- **Identity:** unique one-hot feature for each node
- **Eigen:** eigen decomposition performed on the weighted matrix, then the top k eigenvectors are used to generate a k dimensional feature vector for each node.
- **Degree:** degree value as a one-dimensional vector
- **Degree profile:** $\mathbf{x}_i = [\text{deg}(v_i) \parallel \min(\mathcal{D}_i) \parallel \max(\mathcal{D}_i) \parallel \text{mean}(\mathcal{D}_i) \parallel \text{std}(\mathcal{D}_i)]$,
- **Connection profile:** the corresponding row for each node in the edge weight matrix

M2: Message Passing Mechanisms

Message passing

- **Edge weighted:**

- **Bin concat:**

- **Edge weight concat:** $w_{ij} = \parallel_1^d w_{ij} = w_{ij} \parallel w_{ij} \parallel \dots \parallel w_{ij},$

- **Node edge concat:**

- **Node concat:**

$$\mathbf{m}_i^l = \sum_{j \in \mathcal{N}_i} \mathbf{m}_{ij} = \sum_{j \in \mathcal{N}_i} M_l(\mathbf{h}_i^l, \mathbf{h}_j^l, w_{ij}),$$

$$\mathbf{h}_i^{l+1} = U_l(\mathbf{h}_i^l, \mathbf{m}_i^l),$$

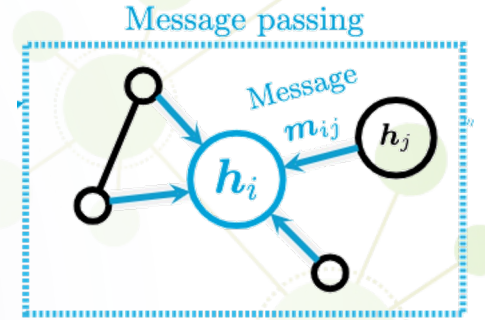

$$\mathbf{m}_{ij} = \mathbf{h}_j \cdot w_{ij}.$$

$$\mathbf{m}_{ij} = \text{MLP}(\mathbf{h}_j \parallel \mathbf{b}_t).$$

$$\mathbf{m}_{ij} = \text{MLP}(\mathbf{h}_j \parallel \mathbf{w}_{ij}).$$

$$\mathbf{m}_{ij} = \text{MLP}(\mathbf{h}_i \parallel \mathbf{h}_j \parallel w_{ij}).$$

$$\mathbf{m}_{ij} = \text{MLP}(\mathbf{h}_i \parallel \mathbf{h}_j).$$

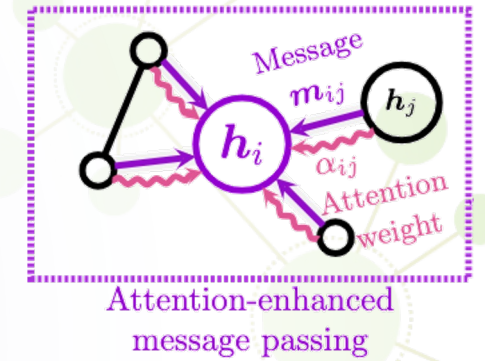

M3: Attention-enhanced Message Passing

- **Attention weighted:**

$$\mathbf{m}_{ij} = \mathbf{h}_j \cdot \alpha_{ij}.$$

$$\alpha_{ij} = \frac{\exp(\sigma(\mathbf{a}^\top [\Theta \mathbf{x}_i \parallel \Theta \mathbf{x}_j]))}{\sum_{k \in \mathcal{N}(i) \cup \{i\}} \exp(\sigma(\mathbf{a}^\top [\Theta \mathbf{x}_i \parallel \Theta \mathbf{x}_k]))},$$

- **Edge weighted w/ attn:**

$$\mathbf{m}_{ij} = \mathbf{h}_j \cdot \alpha_{ij} \cdot w_{ij}.$$

- **Attention edge sum:**

$$\mathbf{m}_{ij} = \mathbf{h}_j \cdot (\alpha_{ij} + w_{ij}).$$

- **Node edge concat w/attn:**

$$\mathbf{m}_{ij} = \text{MLP}(\mathbf{h}_i \parallel (\mathbf{h}_j \cdot \alpha_{ij}) \parallel w_{ij}).$$

- **Node concat w/attn:**

$$\mathbf{m}_{ij} = \text{MLP}(\mathbf{h}_i \parallel (\mathbf{h}_j \cdot \alpha_{ij})).$$

M4: Pooling Strategies

In the second stage of GNNs, a feature vector for the whole graph is computed using the pooling strategy R ,

$$\mathbf{g}_n = R(\{\mathbf{h}_i \mid v_i \in \mathcal{G}_n\}).$$

- Mean pooling:

$$\mathbf{g}_n = \frac{1}{M} \sum_{k=1}^{N_n} \mathbf{h}_k.$$

- Sum pooling:

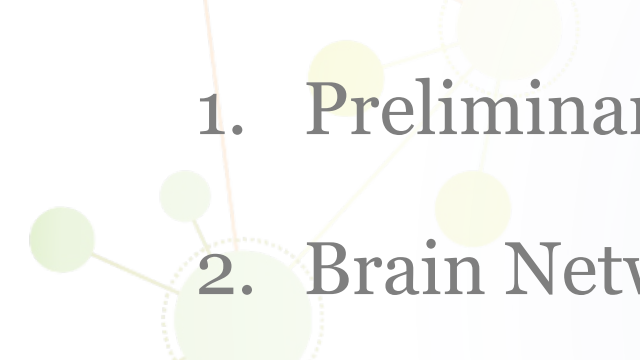

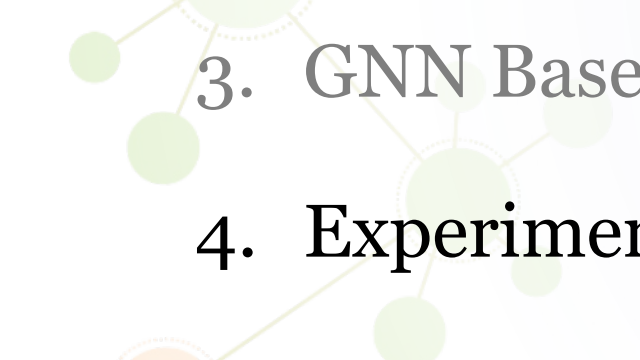

$$\mathbf{g}_n = \sum_{k=1}^M \mathbf{h}_k.$$

- Concat pooling:

$$\mathbf{g}_n = \parallel_{k=1}^M \mathbf{h}_i = \mathbf{h}_1 \parallel \mathbf{h}_2 \parallel \dots \parallel \mathbf{h}_k.$$

Observations

- **Node features:** the connection profile captures the whole picture of structural information in the brain network and preserves rich information on pairwise connections used to perform brain parcellation.
- **Message passing:** node concat reinforces self-representation of the central node during each step of message passing.
- **Attention-enhanced message passing:** the attention mechanism utilizes learnable attention weights in addition to the fixed edge weights in the aggregation and update process of GNNs.
- **Pooling strategies:** in concat pooling, the final node representations of all the brain regions are kept in the graph-level representation for classifiers.

- 
- 

Contributions

- A ***unified, modular, scalable, and reproducible*** framework for brain network analysis with GNNs
- Summarize the preprocessing and construction pipelines for both functional and structural brain networks
- Decompose the design space of GNNs for brain network analysis into four modules:
 - (a) node features
 - (b) message passing mechanisms
 - (c) attention mechanisms
 - (d) pooling strategies.
- Conduct a variety of empirical studies and suggest a set of general recipes for effective GNN designs

BrainGB: A Benchmark for Brain Network Analysis with Graph Neural Networks

BrainGB

A Benchmark for Brain Network Analysis with Graph Neural Networks

BrainGB is a *unified, modular, scalable, and reproducible* framework established for brain network analysis with GNNs. It is designed to enable fair evaluation with accessible datasets, standard settings, and baselines to foster a collaborative environment within computational neuroscience and other related communities. This library is built upon [PyTorch](#) and [PyTorch Geometric](#).

To foster research, we provide an out-of-box package that can be installed directly using pip, with detailed tutorials available on our hosted [website](#).

HennyJie BrainGB Stars 4 Forks 0 python 100.0% total lines 0 license MIT visitors 109 issues 0 open

Library Highlights

Our BrainGB implements four main modules of GNN models for brain network analysis:

- **Node feature construction:** studies practical and effective methods to initialize either positional or structural node features for each brain region.
- **Message passing mechanisms:** update the node representation of each brain region iteratively by aggregating neighbor features through local connections.
- **Attention-enhanced message passing:** incorporates attention mechanism to enhance the message passing scheme of GNNs.
- **Pooling strategies:** operate on the set of node vectors to get a graph-level representation.

BrainGB also implements utility functions for model training, performance evaluation, and experiment management.

Installation

To install BrainGB as a package, simply run

Limitations

- **Graph structure mysteriousness:** for brain networks, what kinds of graph structures (e.g., communities, subgraphs) are effective beyond the pairwise connections are still unknown.
- **Limited Datasets:** the small size of neuroimaging datasets may limit the effectiveness and generalization ability of complex deep learning models.

Future Directions

- **Neurology-driven GNN designs:** to design the GNN architectures based on neurological understanding of predictive brain signals, especially disease-specific ones.
- **Pre-training and transfer learning of GNNs:** to design techniques that can train complex GNN models across studies and cohorts. Besides, information sharing across different diseases could lead to a better understanding of cross-disorder commonalities.

Thanks
