# Background

- Many real-world complex interactive objects can be represented in a form of Heterogeneous Graphs (HGs).
- Existing graph neural networks for HGs require a relatively large amount of labeled data for proper training.

[Sun and Han, 2012] Y. Sun and J. Han, Mining Heterogeneous Information Networks: A Structural Analysis Approach, *SIGKDD Explor. Newsl.*, vol. 14, no. 2, pp. 20–28, 2012.

# Graph Contrastive Learning

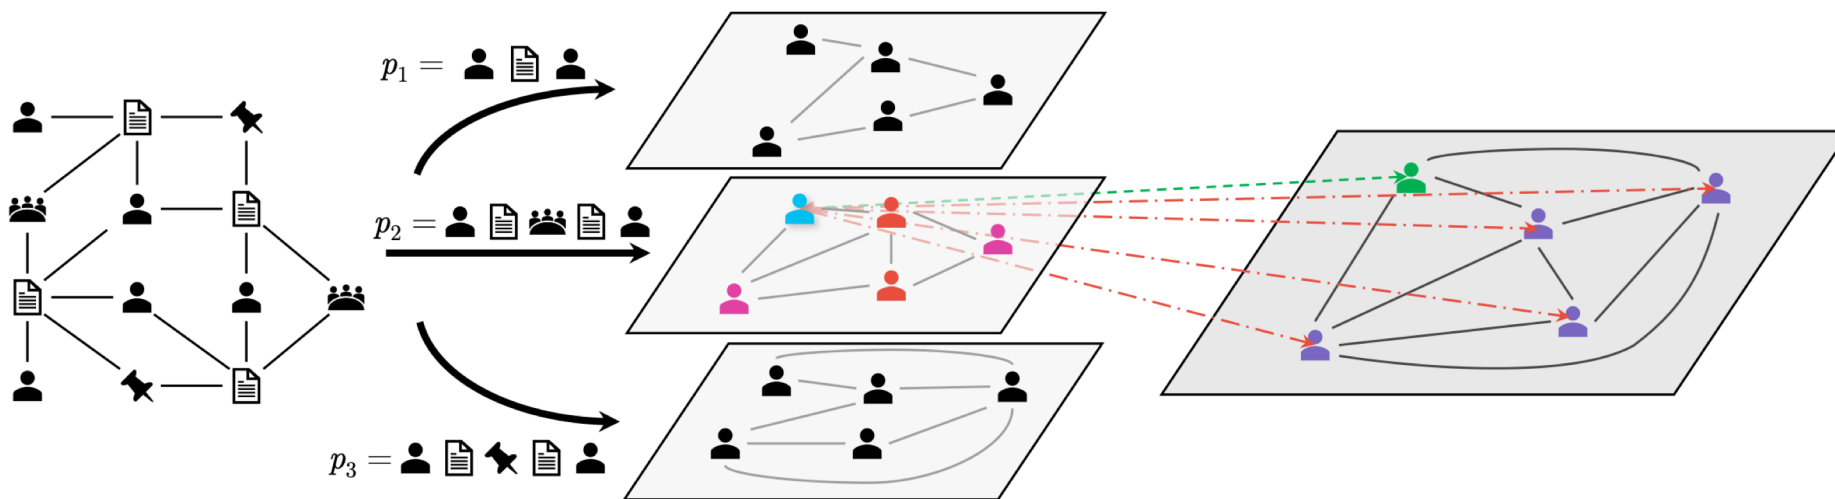

- To alleviate the label scarcity problem, Contrastive Learning (CL) learns representations by distinguishing semantically similar samples (positives) over dissimilar samples (negatives) in the latent space.

[Zhu et al., 2021] Y. Zhu, Y. Xu, F. Yu, Q. Liu, S. Wu, and L. Wang, Graph Contrastive Learning with Adaptive Augmentation, in *WWW*, 2021, pp. 2069–2080.

# Heterogeneous Graph Contrastive Learning

- We first construct **semantic views** according to metapaths.
- Multiview contrastive aggregation objective: to ensure global consistency among semantic views and adaptively encode information from each view.

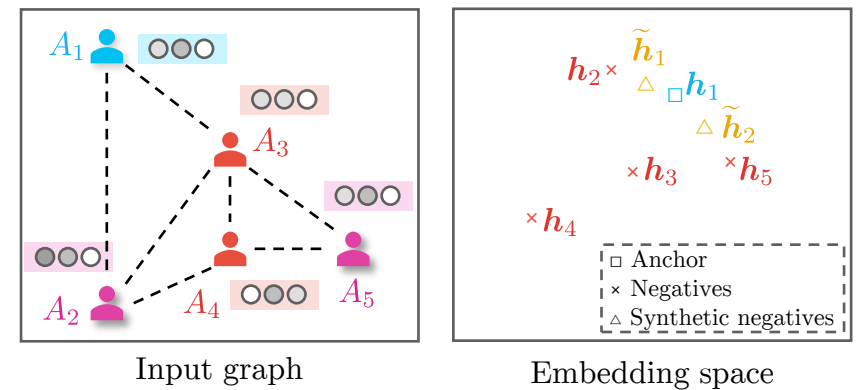

Heterogeneous graph

Semantic views

Aggregated view

# Structure-Aware Hard Negative Mining

- **Hard negative sample** is of particular concern for effective CL.
  - The more similar a negative sample to its anchor, the more helpful it is for learning effective representatives.
- More global view: negative samples sharing similar **structural characteristics** should be pushed away.
- Widely-adopted metrics:
  - Personal PageRank (PPR)
  - Laplacian positional embedding (PE)
  - Distance encoding (DE)
  - ...

# Experiments

| Method       | Training Data  | Node Classification |              |              |              |              |              | Node Clustering |              |              |              |              |              |

# Concluding Remarks

- A novel heterogeneous graph contrastive learning framework with a multiview contrastive aggregation objective that encodes information adaptively from each semantic view.
- A novel hard negative mining scheme to improve the embedding quality, considering the complex structure of heterogeneous graphs and smoothing nature of heterogeneous GNNs.
- Extensive experiments on three real-world heterogeneous datasets demonstrate its effectiveness over both unsupervised and supervised baselines.

A wide-angle photograph of a two-lane asphalt road stretching straight into the distance. The road has a yellow dashed center line and white solid edge lines. The landscape is a dry, open plain with sparse, low-lying shrubs and patches of gravel. In the far distance, a range of low mountains is visible under a clear, bright blue sky. The word "THANKS" is superimposed in large, white, sans-serif capital letters across the center of the image, partially obscuring the horizon and the sky.

# THANKS
